

Understand the clients. Build the next purchase.

Customer analysis and operating brief

Prepared for the team managing TikTok, Instagram, WhatsApp and Facebook, and the person responsible for calling and reactivating existing clients.

Analysis snapshot: 16 September 2026. This brief consolidates the full session analysis and translates it into a proposed working routine for new joiners. It does not establish company policy or platform performance.

Identifiable clients	Repeat clients	Adjusted order value
1,890	701 / 37.1%	903.84 DH average

What the team should take away

Retention already matters. 701 clients have more than one recorded order. Their records account for 66.3% of orders linked to an identifiable client.

The largest pool is first-time buyers. 1,189 clients have one recorded order and need a thoughtful path toward a second purchase.

Value and likelihood are different. High historical spending helps identify valuable relationships; recent buying patterns help prioritise who may return next.

One shared client history is essential. Social conversations, WhatsApp replies, calls and pending orders should lead to one coordinated follow-up.

Reading guide

Pages	Content
2-5	Customer base, order frequency, value rankings and Mme Khadija case study
6-8	Proposed channel roles, reactivation workflow and first-month measurement
9	Ranking methodology, historical test and limitations
10-13	Full ranked list of 100 clients, with phone numbers and timing indicators

Internal use: the appendix contains client contact details. Source throughout: deliveries-1789576322.xlsx, Worksheet. No client was contacted and the source workbook was not changed.

What the export tells us

Measure	Result	Meaning
Delivery records	3,552	All statuses; all 3,552 order codes are distinct
Identifiable clients	1,890	Distinct nonblank phone numbers, excluding "-"
Records linked to clients	3,524	Included in phone-based customer analyses
Missing phone records	28	Cannot reliably assign these to a client
Clients with delivered history	1,849	Eligible population for the next-purchase ranking
Clients without delivered history	41	Excluded from the predictive candidate pool

Current delivery statuses

Status in export	Records	Share of records
Livré	3,445	97.0%
Annulé	95	2.7%
Refusé	5	0.1%
Ramassage en cours	3	0.1%
En attente	2	0.1%
En cours de livraison	2	0.1%

How a client is identified

We use **column G, Téléphone du client**, rather than names. Names may be abbreviated, misspelled or shared by different people. Repeated phone numbers are treated as one client; shared household numbers or a person changing numbers can still affect the count.

How to read dates

Column K is Dernière action (Last action), not order creation date. Recorded actions span 16 September 2025 to 16 September 2026. Timing analysis describes this export window, not necessarily a client's full lifetime history.

Source: Worksheet!B2:C3553, G2:G3553 and K2:K3553. Status shares describe records in this export; they are not independently verified fulfilment KPIs.

How often clients have ordered

1,189 clients ordered once; 701 ordered more than once. The repeat-client share is 37.1%. This is a historical customer mix, not a cohort retention rate.

Orders per client	Clients	Share of clients
1	1,189	62.9%
2	342	18.1%
3	153	8.1%
4	80	4.2%
5	49	2.6%
6	33	1.7%
7	15	0.8%
8	8	0.4%
9	7	0.4%
10	5	0.3%
11	2	0.1%
12	2	0.1%
13	1	0.1%
15	1	0.1%
20	1	0.1%
23	1	0.1%
30	1	0.1%
Total	1,890	100.0%

Order counts not listed have zero clients. Counts include all statuses and exclude the 28 records without a usable phone number.
Source: Worksheet!G2:G3553.

Implication for the new team

Use two distinct follow-up paths: help one-order clients make a second purchase, and maintain established relationships with repeat buyers. The 701 repeat clients account for 2,335 of 3,524 identifiable order records (66.3%).

Average value and top 10 clients

Adjusted average order value: 903.84 DH. This uses all 3,552 records, including pending, cancelled, refused and missing-phone records. It is an order-value measure, not collected revenue.

Calculation	Amount
Sum of recorded Montant total	2,925,448.50 DH
285 zero values replaced by 1,000 DH	+285,000.00 DH
Adjusted combined value	3,210,448.50 DH
Adjusted total / 3,552 orders	903.84 DH per order

Highest combined adjusted order value

Rank	Client	Phone	Orders	Value (DH)
1	Mme khadija	0661222524	30	44,765
2	Mme Ghizlane	0661131175	20	22,900
3	Mme Hayat	0641020604	23	20,015
4	Mme Fadila	0663129630	10	19,455
5	Mme Dounia	0661355388	12	15,029
6	Mme Sara	0673583341	15	15,000
7	Mme Fadila	0708236985	5	14,060
8	Mme Samira	0661858817	12	13,180
9	Mme Jamila	0661075059	9	12,130
10	Mme Imane	0662601016	8	12,110

How to use this ranking

These totals identify valuable historical relationships. They do not show profit, cash collected or who is most likely to buy next. The two Mme Fadila entries are distinct phone-based clients.

Estimate sensitivity: all 15 of Mme Sara's orders have recorded value 0, so her entire 15,000 DH adjusted total comes from the requested replacement rule. A zero may have several causes; the file does not explain them.

Sources: Worksheet!F2:F3553 for values, G2:G3553 for grouping and I2:I3553 for names. The 0-to-1,000 DH rule is a user-specified analytical assumption; recorded values were not overwritten.

Mme Khadija: the most frequent client

Field	Finding
Client / phone	Mme Khadija / 0661222524
Recorded orders	30: 29 delivered and 1 pending
Combined adjusted value	44,765 DH
Adjusted average order value	1,492.17 DH = 44,765 / 30
Zero-value orders	3, each treated as 1,000 DH
Earliest recorded action	25 September 2025 at 12:19
Earliest record code	DH12E6E2BC7
Latest delivered action	25 August 2026
Pending record action	14 September 2026
Typical delivered-record gap	8.5 days, median between distinct action dates

What this illustrates

The same client appears with different capitalisation and one spelling variant, "Mme khadiha". Matching by phone keeps those records together.

Her earliest recorded action is not necessarily her first-ever purchase or the order creation date. It is the oldest action shown for her in this export.

She ranks first in the next-purchase model, but already has a pending order. The useful first step is to check that order, rather than initiate a duplicate sales conversation.

A useful handoff example

If she replies to an Instagram post or sends a WhatsApp message, the social team checks the shared client record, notes the existing order and assigns any delivery question to the relevant owner. The caller resumes a reorder conversation only when appropriate.

Source: records matching phone 0661222524 in Worksheet!G2:G3553. Earliest action: K3424; name/phone: G3424:I3424; pending record: row 16. Value calculations use column F across all 30 matching records.

Social channels and client handoffs

The following is a proposed operating approach for onboarding. The delivery export contains no channel attribution, audience analytics, content results or advertising costs, so it cannot tell us which platform generates the best customers.

Channel / role	Primary job	Useful handoff
TikTok	Develop short product-led content from approved product information and recurring customer questions. Log comments that signal purchase interest.	Move a purchase enquiry into the shared client log and the agreed ordering conversation.
Instagram	Build a consistent product story; organise questions from comments and direct messages; develop useful answers and customer content with permission.	Record the enquiry, known phone number, product interest and next action.
Facebook	Maintain clear product information and respond to incoming messages and comments. Reuse suitable content with channel-appropriate editing.	Route purchase questions and service issues to the correct owner.
WhatsApp	Manage the customer conversation: answer questions, confirm the next step and keep the order or follow-up status current.	Check for an existing order or caller assignment before starting a new follow-up.
Reactivation caller	Review purchase history, contact assigned clients and learn whether they need a reorder, later reminder or service resolution.	Record the outcome and agreed follow-up; return recurring questions to the content team.

One shared workflow

Interest → client record → assigned owner → conversation → order → delivery → follow-up. Match by phone when available, preserve the original source of the enquiry, and give each active follow-up one owner.

The content feedback loop

Each week, collect repeated questions, reasons for delay and service issues from messages and calls. Turn these into useful content topics. Product claims, prices and offers should come from SN Nutrition's approved information, not from this analysis.

Suggested workflow, not an assessment of current team performance. This brief does not infer personal health needs or recommend products from purchase history.

A practical calling and follow-up routine

The appendix is a starting queue for the next 30 days, ending 16 October 2026. Rank indicates relative priority, not a scheduled call date or a promise that a client will buy.

Step	Action
1. Review	Read the client history, last delivered activity and typical gap. Check current orders and existing conversations.
2. Choose the right moment	If there is a pending order, resolve it first. If the client purchased very recently, use a service check-in rather than an immediate reorder request.
3. Start a conversation	Introduce yourself, check whether it is a good time, ask about the previous order and whether a reorder or later reminder would be useful.
4. Record the answer	Use a clear outcome: interested, order placed, follow up on an agreed date, no current need, no answer, service issue, wrong number or do not contact.
5. Close the loop	Record owner, next step and date. Count an order as delivered only after delivery is recorded. Keep service issues separate from sales follow-up.

Draft call opener

"Hello [name], this is [name] from SN Nutrition. Is this a good time for a quick call? I'm following up on your previous order. How did everything go? Would you like help with another order, or would a reminder later be more useful?"

Draft WhatsApp follow-up

"Hello [name], it's [name] from SN Nutrition. Following our conversation, here is [the requested information / the order summary]. We agreed that I would [next step] on [date]. Please let me know if your plans change."

Handle the answer, not just the ranking

If the client has enough product, agree a suitable later date. If there is an unresolved issue, route it for resolution. If they decline future contact, record that preference. Use the client's preferred language and keep the history available to the social team.

Draft scripts for adaptation by the team. The analysis does not authorise sending messages or making calls; none were sent or made during this work.

Measure the work and improve the list

Timing	Proposed focus	Review output
Week 1	Review the baseline, approved product information, inbox ownership and the client log. Check the top 25 candidates and existing pending orders.	A clean queue, clear owners and consistent outcome labels.
Week 2	Start a manageable calling batch and log social enquiries. Prioritise agreed follow-up dates over blind repeat attempts.	Conversation outcomes, orders linked to contacts and recurring questions.
Week 3	Review reasons for delay and unresolved issues. Turn repeated questions into content. Test a separate small batch of one-order clients.	What helps a second purchase, and where service or information is missing.
Week 4	Reconcile placed and delivered orders. Compare outcomes by client segment and recorded enquiry source. Refresh the export and queue.	A next-month plan based on observed results, not follower counts alone.

Minimum shared client log

Phone; name; assigned owner; enquiry source; last contact date; contact channel; outcome; next agreed action/date; linked order code; order status; recorded order value; contact preference. Keep the source of the first enquiry separate from later assistance.

Metrics with clear denominators

Metric	Definition
Contact rate	Clients reached / unique clients attempted
Order conversion	Clients placing an order after contact / clients reached
Delivered conversion	Clients with a linked delivered order / clients reached
One-order client progression	Contacted one-order clients with a second order / one-order clients contacted
Channel contribution	Linked enquiries, orders and delivered value by recorded source; keep unknown source visible
Follow-up completion	Agreed follow-ups completed / follow-ups due in the period

Use a consistent 30-day outcome window. Report actual recorded value separately from the 1,000 DH zero-value assumption. Contact-to-order attribution shows association; it does not prove the contact caused the purchase. No numerical targets are set because staffing capacity and campaign baselines were not supplied.

How the 100-client ranking was built

Question: among existing clients with a delivered-order history, who has stronger evidence of returning within the next 30 days? The ranking considers 1,849 clients. It excludes 41 identifiable clients with no delivered records and 28 records without phone numbers.

Inputs and approach

A regularised logistic model used delivered-order count, days since latest delivered action, observed history length, delivered records in the last 30 and 90 days, median gap between distinct delivered-action dates, recency relative to that gap, and whether the client had only one delivered record. Numeric inputs were log-transformed and standardised. Clients without an observed repeat gap received a 60-day placeholder; their one-order flag was also included.

Seven monthly historical snapshots were used for training, with non-overlapping 30-day outcome windows. An untouched snapshot at 17 August 2026 was used for the historical comparison. The model was then refitted including that completed window to produce the 16 September ranking. Spend was not used, so replacing zero values with 1,000 DH does not affect this list.

17 Aug to 16 Sep historical comparison	Returned within 30 days
Model-selected top 100	27 / 100
Top 100 by delivered-order frequency	26 / 100
Top 100 by most recent delivered activity	17 / 100
All eligible clients at the test snapshot	101 / 1,773 (5.7%)

What the test establishes

The model concentrated more returners than the full eligible pool, but improved on the frequency-only list by just one client. One historical window is weak evidence for fine differences between ranks. Treat the list as a useful prioritisation queue, not a calibrated probability forecast.

Important limits

Dates and statuses were reconstructed from one current export. A last-action date can change after an order is placed, and historical status snapshots are unavailable. The test therefore measures a proxy for future delivered activity, not verified future order creation. The file covers about one year; earlier purchases, client preferences, campaigns and contact history are absent.

Pending orders do not drive the score. They are flagged in the appendix so the team can prevent duplicate outreach. Counts in the appendix are **delivered orders**; earlier frequency and value tables use **all statuses**.

Source mapping: B = status; C = order code; F = Montant total; G = client phone; I = full name; K = last action. Appendix name at rank 19 is corrected to Mr Mohamed, matching the source; the earlier chat table incorrectly used Mme.

Follow-up candidates 1-25

Priority for 17 September-16 October 2026. Delivered history only. "Days" is elapsed time since latest delivered action as of 16 September. "Gap" is the median interval in days between distinct delivered-action dates.

Rank	Client	Phone	Orders	Days	Gap
1	Mme khadija *	0661222524	29	22	8.5
2	Mme Maha Mamdouh	0663178168	13	6	25
3	Mme Ghizlane	0661131175	20	40	10
4	Mme Jamila	0662895904	11	13	21.5
5	Mme Hayat	0641020604	23	62	12.5
6	Mme Jamila	0661075059	9	2	18
7	Mme Samira	0661858817	12	27	25
8	Mr abdelhakim	0662429323	8	7	26
